

x-tant project

I was very interested in this instrument and I made it in Plywood 8 mm.
It was not getting a real beauty, but a very stable instrument en easy to make.

The technical results are very good, I tried it out on the seaside on a well-known place for the coordinates (Tom-Tom) .With a bright sunshine and a free horizon, the deviations ,compared with a computer-program on that time and place normally were only +/- one, or at most two minutes!
